

SecureCall:

FACE TO FACE

EDUCATION

In the new world that we find ourselves in, post-COVID19, the importance of video-calling, and online communication has become an incredibly prevalent part of society.

Remote working has become a new way of life; it's the new normal. There's now a need to ensure that the individual on the other end of the call, is who they say they are.

SecureCall is a tool which can be used to **verify, monitor** and **safeguard** individuals taking part in an online call.

As a partner of Microsoft, we're developing our software to run alongside Microsoft Teams. This software acts as a call monitor; ensuring that both the call attendee and organiser are who they say they are.

Users upload a 'face', which is then validated to our technical requirements. This face is then assigned to an email address and can then be used to verify the user on the call.

This software is **vital** to a host of sectors, the **education** sector in particular.

As classroom teaching converts to online learning, within the education sector, safeguarding online is an indispensable resource.

SecureCall can be used to ensure that both **teacher** and **student** can be verified, but equally, that a minimum of two students are participating in a call at one time.

Reports can also be made to parents on when a call has taken place, the call duration, and who the calls were made to.

By using **SecureCall**, the student, parent and teacher are reassured that they're communicating with the correct person. This offers an extra level of **security** and **safeguarding** and is a vital tool for modern day society.
